Parts and optional questions

1 – Creating parts: setup

This feature is useful if an exam has multiple parts and a weighting is applied to these parts. In this example, Part A consists of 3 questions with a total mark of 30, Part B of 2 questions with a total mark of 20, and Part C of 3 questions with a total mark of 60. The module leader wants these parts to be weighted equally.

1. **Select number of parts and associated question range and define weight for each part.**
2. **'Reset Weights' applies the weighing equally (especially important if there are 3 parts, as the maths behind expect a weighting of 33.3333333 – which can not be done manually).**
3. **Parts are shown in Category allocation.**
4. **The weighting is applied, resulting in weighted maximum marks. In this example, the sum of question marks must be the same for each part, as the weight has been defined as 33.3% each. In this example, they sum up to 30 for each part.**
5. **The maximum original (black) and weighted (blue) marks will be shown in the Marking Table**
6. **Marking is done using the original marks ("marks as they are shown in the exam paper", e.g., out of 10 or 20 in this example). INDAF then applies the correct weighting in blue.**

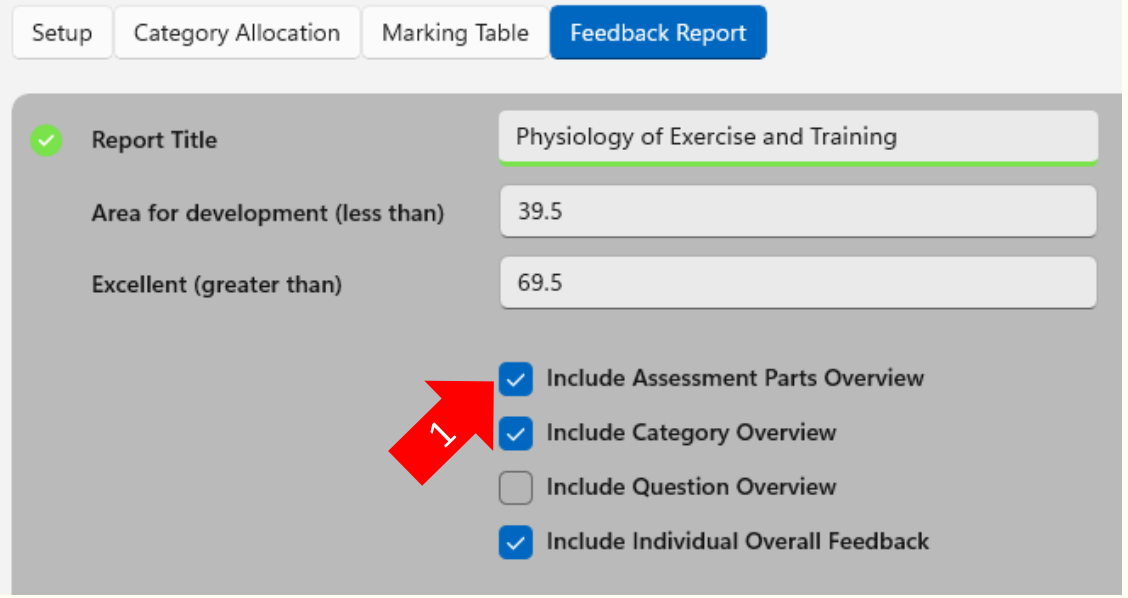

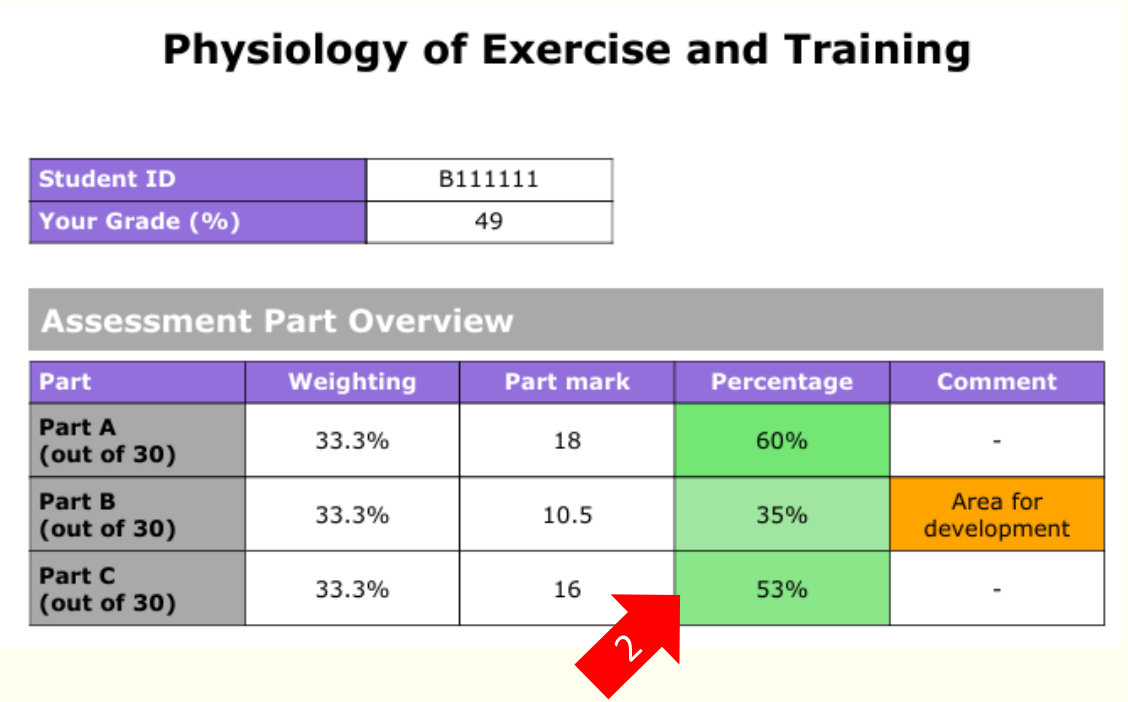

Parts and optional questions

1 – Creating parts: feedback

1. **To include parts information in the feedback report, make sure to select the appropriate option.**
2. **The feedback report will show the performance for each part separately.**

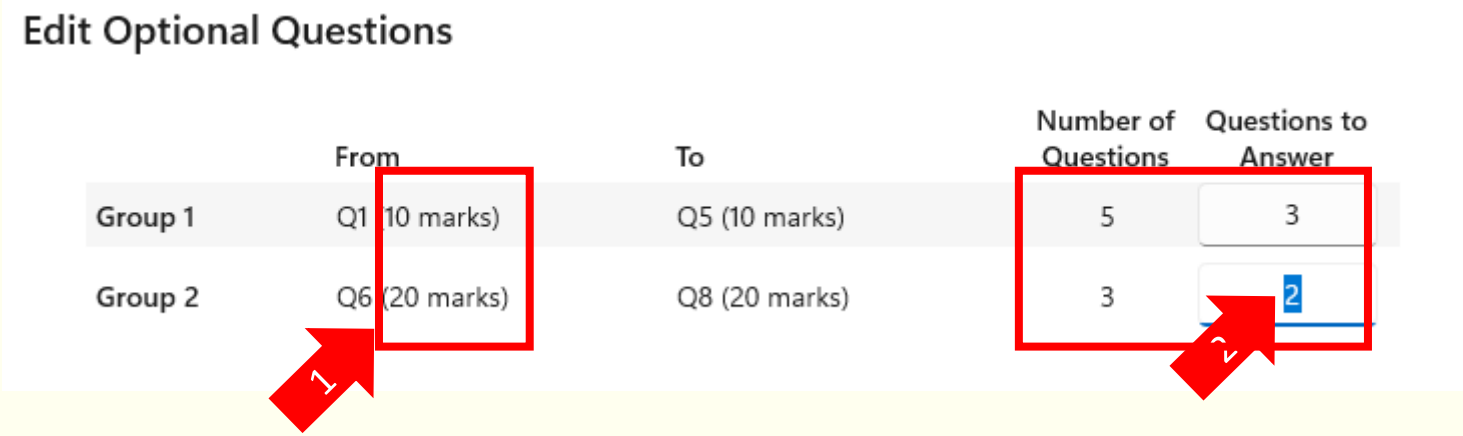

Parts and optional questions

2 – Identifying optional questions

This feature is useful if an exam has optional questions – i.e., not all questions need to be answered.

1. **INDAF groups the questions according to heir maximum mark.**
2. **The user selects the number of question in each group that must be answered.**
3. **INDAF displays a summary.**
4. **INDAF adjusts the Total awarded.**
5. **For more complex cases, users can manually adjust the Total.**

Parts and optional questions

3 – Identifying optional parts

This feature is useful if an exam has optional parts – i.e., not all parts need to be answered. The logic is the same as for identifying optional questions.

1. **The user selects the number of parts that must be answered**
2. **INDAF displays a summary**
3. **INDAF adjusts the Total awarded**
4. **For more complex cases, users can manually adjust the Total**
